_____/ 24

30 minutes maximum. 24 points possible; each part is worth 2 points. No aids (book, notes, calculator, phone, etc.) are permitted. Show all work and use proper notation for full credit. Answers should be in reasonably-simplified form.

1. [12 points] Compute the derivatives of the following functions.

a. $f(x) = e^2 x^{1/2} + 2e^x + \sqrt{9}$ ← a constant

$$f'(x) = e^2 \cdot \frac{1}{2} x^{-1/2} + 2e^x = \frac{e^2}{2\sqrt{x}} + 2e^x$$

b. $f(x) = \ln(\cos(x^3) - 4x^7)$

$$f'(x) = \frac{1}{\cos(x^3) - 4x^7} \cdot (-\sin(x^3)3x^2 - 28x^6)$$

$$= -\frac{3x^2 \sin(x^3) + 28x^6}{\cos(x^3) - 4x^7}$$

c. $h(x) = \sin(kx^2 - 5)$ where k is a constant

$$h'(x) = \cos(kx^2 - 5) (2kx)$$

$$= 2kx \cos(kx^2 - 5)$$

d. $f(x) = \sec(xe^x)$

$$f'(x) = \sec(xe^x) \tan(xe^x) (1 \cdot e^x + x \cdot e^x)$$

$$= e^x (1+x) \sec(xe^x) \tan(xe^x)$$

e. $y = \frac{\cos(2x)}{x^5 + \pi}$

$$\frac{dy}{dx} = \frac{-\sin(2x)(x^5 + \pi) - \cos(2x)(5x^4)}{(x^5 + \pi)^2}$$

f. Find $\frac{dy}{dx}$ if $e^y \cos(x) = xy + 1$. You must solve for $\frac{dy}{dx}$.

product here *product here*

$$e^y \frac{dy}{dx} \cos(x) + e^y (-\sin(x)) = 1 \cdot y + x \cdot \frac{dy}{dx}$$

$$\frac{dy}{dx} (e^y \cos(x) - x) = y + e^y \sin(x)$$

$$\frac{dy}{dx} = \frac{y + e^y \sin(x)}{e^y \cos(x) - x}$$

2. [12 points] Compute the following antiderivatives (indefinite integrals) and definite integrals. Remember that antiderivatives need a "+C".

u=1+x" does not work here

$$\text{a. } \int \frac{(1+x)^2}{2x} dx = \int \frac{1+2x+x^2}{2x} dx = \int \frac{1}{2} \frac{1}{x} + 1 + \frac{1}{2} x dx$$

$$= \frac{1}{2} \ln|x| + x + \frac{x^2}{4} + C$$

b. $\int (x-1) e^{((x-1)^2)} dx$

$$= \int e^u \frac{du}{2}$$

$$= \frac{1}{2} e^u + C$$

$$= \frac{1}{2} e^{(x-1)^2} + C$$

$$\begin{aligned} u &= (x-1)^2 \\ du &= 2(x-1) dx \\ \frac{du}{2} &= (x-1) dx \end{aligned}$$

c. $\int_0^\pi 5e^x + 3\sin(x) dx$

$$\hookrightarrow \left[5e^x - 3\cos(x) \right]_0^\pi$$

$$= (5e^\pi - 3(-1)) - (5e^0 - 3 \cdot (1))$$

$$= 5e^\pi + 3 - 5 + 3 = 5e^\pi + 1$$

d. $\int x\sqrt{x+5} dx$

$$= \int (u-5)\sqrt{u} du$$

$$= \int u^{3/2} - 5u^{1/2} du$$

$$= \frac{2}{5} u^{5/2} - 5 \cdot \frac{2}{3} u^{3/2} + C$$

$$= \left(\frac{2}{5} (x+5)^{5/2} - \frac{10}{3} (x+5)^{3/2} \right) + C$$

e. $\int \frac{\cos(\ln x)}{x} dx$

$$\rightarrow = \int \cos(u) du$$

$$= \sin(u) + C = \sin(\ln x) + C$$

f. $\int \frac{\sec^2(x)}{\tan^2(x)} dx$

$$= \int \frac{du}{u^2} = \int u^{-2} du$$

$$= -u^{-1} + C = -(\tan x)^{-1} + C$$

$$= -\cot x + C$$

this form is better because you can distribute

$$\left[\begin{array}{l} u = x+5 \\ \Downarrow \\ x = u-5 \\ du = dx \end{array} \right]$$

key part

$$\left[\begin{array}{l} u = \ln x \\ du = \frac{1}{x} dx \end{array} \right]$$

$$\left[\begin{array}{l} u = \tan x \\ du = \sec^2 x dx \end{array} \right]$$

don't write $^{-1} x$ because it is ambiguous
